

Customer Journey Map

Date	30 September 2026
Team ID	SWTID-2026-8305
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1 Open the Incident Form	Stage 2 Enter and Edit Incident Details	Stage 3 Submit and Validate the Record
Actions <i>What does the customer do?</i>	- Opens Incident > New - Fills Short description, Impact - Sees UI Policy rules on load	- Changes Impact or Urgency - Edits a value in the Incident list - Notices Urgency turn read-only	- Clicks Submit / Save - Reads the validation message - Corrects the data and saves again
Touchpoint <i>What part of the service do they interact with?</i>	- ServiceNow login page and Incident application - Incident form (incident table) - UI Policy: High Impact Control	- Impact, Urgency and Priority fields - onChange Client Script - UI Policy Action on Urgency; onCellEdit script in list view	- Submit button on the form - onSubmit Client Script (Save Validation) - Incident record saved in the incident table
Customer Thought <i>What is the customer thinking?</i>	"Which fields do I need to fill in?" "I hope only relevant fields are enabled." "High impact tickets need extra care."	"Why is Urgency locked for this incident?" "Will it warn me if I pick a wrong value?" "Quick edits from the list should be safe too."	"Did my data pass the checks?" "I want a clear error message, not a blank page." "I do not want to redo the ticket later."
Customer Feeling <i>What is the customer feeling?</i>	Curious but slightly unsure which fields are required, because the form is new to the user.	Guided and in control, because the form reacts instantly to every change without reloading.	Relieved when a valid record saves; a blocked save feels fine because the message explains why.

Process Ownership <i>Who is in the lead on this?</i>	ServiceNow Admin: creates the UI Policy and UI Policy Action on the Incident table (Milestones 1-2).	ServiceNow Developer: writes the onChange and onCellEdit Client Scripts (Milestones 3 and 5).	Team Lead and team testers: build the onSubmit script and test the full configuration (Milestones 4 and 6).
Opportunities <i>How can we improve this stage?</i>	• Show or hide fields using UI Policy conditions • Make key fields mandatory • Add helpful guidance on form load	• Lock Urgency for high-impact incidents • Give instant alerts on wrong values with onChange • Stop risky inline edits with onCellEdit	• Block incomplete saves before they reach the server • Show clear, specific error messages • Extend validation to more fields later
