

Data Flow Diagram

Date	30 September 2026
Team ID	SWTID-2026-8305
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Data Flow Diagram

Create a Data Flow Diagram (DFD) to show how data moves through your system - between external entities, processes, and data stores. Use the symbol legend below as a guide.

DFD Symbol Legend

Symbol	Name	Description
Oval / Rounded shape	External Entity	A person, organization, or system outside the project that sends or receives data (e.g., Customer, Payment Gateway).
Rectangle with numbered header	Process	An activity that transforms incoming data into outgoing data (e.g., Validate Request, Process Order).
Rectangle (solid fill, no number)	Data Store	A place where data is held for later use (e.g., Customer Database, Inventory).
Labeled arrow	Data Flow	The movement of data between entities, processes, and data stores, labeled with what data is being passed.

Data Flow Diagram of this Project

The next page shows how data moves between the User, the client-side processes (UI Policy and Client Scripts) and the ServiceNow tables for the Incident form.

Level 1 DFD - Incident Form with UI Policy and Client Scripts

Data flow description

1. The ServiceNow Admin creates and updates the UI Policy, UI Policy Action and Client Script records stored in D1.
2. When the User opens a new Incident form, Process 1 reads the policy rules from D1 and applies the field actions. For example, the “High Impact Control” UI Policy makes the Urgency field read-only.
3. When the User changes a field value, or edits a cell in the Incident list, Process 2 runs the onChange or onCellEdit Client Script read from D1 and returns an alert or field update.
4. When the User clicks Submit, Process 3 runs the onSubmit (Save Validation) script. Invalid data returns an error message and the save is blocked.
5. Valid data is saved to the Incident table (D2) and a confirmation is shown to the User.
