

Solution Requirements

Date	30 September 2026
Team ID	SWTID-2026-8305
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR)** define specific behaviors, functions, or features of the system (What the system should *do*).
- **Non-Functional Requirements (NFR)** specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should *be*).

Fill out the descriptions and necessary details for each category provided below.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Authentication	No third-party login is needed. Users sign in to the ServiceNow instance with their own username and password, and only signed-in users can open the Incident form.	High
2	Authorization levels	Admin or developer role: create and edit UI Policies and Client Scripts. ITIL users: raise and update incidents and see the form behaviour. Other roles: no access.	High
3	External interfaces	No third-party APIs or external databases. Only built-in ServiceNow client APIs (g_form, g_user) and the Incident table are used.	Low

4	Transactions processing	On Submit, the onSubmit script checks the entered data before the record is saved to the incident table. Invalid data blocks the save with a message.	High
5	Reporting	Incident list and standard reports can be filtered by Impact, Urgency and Priority to confirm the rules are working. No custom dashboard is required.	Low
6	Business rules, etc.	UI Policy "High Impact Control" sets Urgency read-only. The onChange script reacts to field changes and the onCellEdit script checks inline edits in the list.	High
7	Compliance to laws or regulations	Follows the organisation's existing ServiceNow access controls (ACLs). Only standard incident fields are used, so no extra personal data is collected.	Medium
8	<i>Other</i>	All rules run in the browser instantly, without a page reload, on both the Incident form and the Incident list view.	Medium

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria

1	Performance & Speed	UI Policies and Client Scripts run in the browser, so form rules apply without an extra server call.	Form reacts to a change in under 1 second
2	Scalability	Rules are defined once on the Incident table, so they apply to every user and every incident.	Works for all users of the Incident form
3	Security & Data Privacy	Only users with the admin or developer role can edit policies and scripts. Incident data stays protected by ACLs.	No unauthorised edits; ACLs enforced
4	Reliability & Availability	The same rule gives the same result on every form load. Availability depends on the ServiceNow instance.	All Milestone 6 test cases pass
5	Usability & Accessibility	Clear alerts and error messages. Read-only and mandatory fields guide the user. Works on modern browsers.	Works in Chrome, Edge and Firefox
6	<i>Other</i>	Maintainability: each UI Policy and Client Script has a clear name and a short comment on its purpose.	Any admin can understand and edit a rule
