

## Code-Layout, Readability and Reusability

|                      |                                                |
|----------------------|------------------------------------------------|
| <b>Date</b>          | 15 March 2026                                  |
| <b>Team ID</b>       | SWTID-2026-8305                                |
| <b>Project Name</b>  | Implement Client Script & UI Policy (Incident) |
| <b>Maximum Marks</b> | 5 Marks                                        |

### Code-Layout, Readability and Reusability:

This document evaluates the quality of the codebase in terms of its structure, readability, and reusability. Well-organized code with proper naming conventions, comments, and modular design ensures that the project is maintainable and can be extended or reused in future development.

### Code Layout Checklist:

| S.No | Code Quality Parameter    | Description                                   | Followed (Yes / No / Partial) | Remarks                                                                                      |
|------|---------------------------|-----------------------------------------------|-------------------------------|----------------------------------------------------------------------------------------------|
| 1    | Consistent Indentation    | Uniform spacing/tabs used throughout the code | Yes                           | Scripts use the same 4-space indentation and brace style.                                    |
| 2    | Proper File Structure     | Files and folders are logically organized     | Yes                           | Each script / policy is a separate ServiceNow record on the Incident table.                  |
| 3    | Meaningful Variable Names | Variables reflect their purpose clearly       | Yes                           | Names like newValue, oldValues, table, sysIDs.                                               |
| 4    | Function / Method Names   | Functions are descriptively named             | Yes                           | Standard names: onChange, onSubmit, onCellEdit.                                              |
| 5    | Code Comments             | Inline and block comments explain logic       | Partial                       | Basic comments present; more inline comments can be added.                                   |
| 6    | Modular Design            | Code is split into reusable functions/modules | Yes                           | One script per behaviour (change, submit, list edit).                                        |
| 7    | No Redundant Code         | Duplicate or unused code is removed           | Yes                           | No duplicate or unused logic in the scripts.                                                 |
| 8    | Error Handling            | Exceptions and errors are handled gracefully  | Yes                           | Invalid save or list edit is blocked with a clear message; callback(false) rejects the edit. |

### Reusable Components / Modules:

| S.No | Component / Module Name                                | Language / Technology       | Where Reused                                                            | Reusability Level (High / Medium / Low) |
|------|--------------------------------------------------------|-----------------------------|-------------------------------------------------------------------------|-----------------------------------------|
| 1    | UI Policy: conditional field behaviour                 | ServiceNow UI Policy        | Other Incident form conditions; Problem and Change forms                | Medium                                  |
| 2    | UI Policy Action: Urgency                              | ServiceNow UI Policy Action | Any field on the Incident form that needs mandatory / read-only control | Medium                                  |
| 3    | onChange Client Script                                 | JavaScript (ServiceNow)     | Any field-change handling on Incident or other tables                   | High                                    |
| 4    | onSubmit validation script                             | JavaScript (ServiceNow)     | Any form that needs save validation                                     | High                                    |
| 5    | onCellEdit script (Prevent state change via list edit) | JavaScript (ServiceNow)     | List views of other tables or fields that must not be edited inline     | Medium                                  |

### Overall Code Quality Assessment:

| Aspect                   | Rating (1-5) | Comments                                                      |
|--------------------------|--------------|---------------------------------------------------------------|
| Code Layout & Structure  | 4            | One clearly named script / policy per behaviour.              |
| Readability              | 4            | Short scripts with clear names and consistent indentation.    |
| Reusability              | 4            | Scripts and policies can be copied to other tables or fields. |
| Documentation / Comments | 3            | Basic comments; more explanation can be added.                |
| <b>Overall Score</b>     | 3.75         | Average of the four ratings (out of 5).                       |
