| <b>Project Name</b>  | Implement Client Script & UI Policy (Incident) |
| <b>Maximum Marks</b> | 5 Marks                                        |

### Coding & Solution

This section evaluates the quality and completeness of the implemented code and the overall solution. The solution adds Client Scripts and UI Policies to the ServiceNow Incident form to improve user experience, enforce field behaviour and reduce incorrect data entry, all without needing the form to be submitted.

### Solution Summary

| Field                                | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Programming Language(s)</b>       | JavaScript (ServiceNow client-side scripting)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Framework(s) Used</b>             | ServiceNow platform (Personal Developer Instance): Client Scripts, UI Policies, UI Policy Actions, GlideForm (g_form) API                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Key Features Implemented</b>      | <ol style="list-style-type: none"> <li>1. UI Policy on Incident: fields become mandatory / visible / read-only based on conditions.</li> <li>2. UI Policy Action on Urgency: Urgency field behaviour controlled dynamically.</li> <li>3. onChange Client Script: reacts instantly when a field value changes.</li> <li>4. onSubmit Client Script: save validation that blocks invalid or incomplete incidents.</li> <li>5. onCellEdit Client Script ("Prevent state change via list edit"): stops State being changed from the list view and shows an alert.</li> <li>6. Tested all policies and scripts on the Incident form and list view.</li> </ol>                  |
| <b>Pending / Incomplete Features</b> | Final demo link and GitHub repository link to be added to the project page for mentor review.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Setup / Run Instructions</b>      | <ol style="list-style-type: none"> <li>1. Create a free ServiceNow Personal Developer Instance (PDI) at developer.servicenow.com.</li> <li>2. Log in with the admin role and confirm Incident Management is enabled.</li> <li>3. Go to System UI &gt; UI Policies, create the Incident UI Policy and add the Urgency UI Policy Action.</li> <li>4. Go to System Definition &gt; Client Scripts and create the onChange, onSubmit and onCellEdit scripts on the Incident table (UI Type: Desktop, Active).</li> <li>5. Open an Incident form and the Incident list, change fields, try saving invalid data and editing State in the list to see the behaviour.</li> </ol> |

## Code Quality Checklist

| S.No | Criteria                                               | Status (Yes / No) |
|------|--------------------------------------------------------|-------------------|
| 1    | Code is modular and organized into functions / classes | Yes               |
| 2    | Meaningful variable and function names are used        | Yes               |
| 3    | Code includes comments / documentation where necessary | Partial           |
| 4    | Error handling is implemented for critical operations  | Yes               |
| 5    | The application runs without critical errors           | Yes               |
| 6    | Code is committed to a version control repository      | Yes               |

## Additional Notes / Comments:

Each behaviour is built as its own small, clearly named UI Policy or Client Script on the Incident table, so it is easy to test and maintain. Scripts use the standard ServiceNow function names (onChange, onSubmit, onCellEdit). Invalid actions are stopped with a clear message to the user (for example, State cannot be updated from list editing). Short comments exist in the scripts and more can be added.
